List coloring and choosability

List coloring

A list assignment for a graph G is a function that to each vertex $v \in V(G)$ assigns a set $L(v)$ of colors, and an L-coloring is a proper coloring ϕ such that $\phi(v) \in L(v)$ for all $v \in V(G)$.

Choosability

The choosability of graph G is the minimum integer k such that G has an L-coloring for every assignment L of lists of size at least k.

Flexibility

Satisfying a precoloring on a constant fraction of precolored vertices, for ordinary proper coloring, the answer is always positive as long as any coloring of the graph using the fixed number of colors exists.

Flexibility

Satisfying a precoloring on a constant fraction of precolored vertices, for ordinary proper coloring, the answer is always positive as long as any coloring of the graph using the fixed number of colors exists.

Request

A request for a graph G with a list assignment L is a function r with $\mathrm{dom}(r) \subseteq V(G)$ such that $r(v) \in L(v)$ for all $v \in \mathrm{dom}(r)$.

ε-satisfiable request

For $\varepsilon > 0$, a request r is ε-satisfiable if there exists an L-coloring ϕ of G such that $\phi(v) = r(v)$ for at least $\varepsilon|\mathrm{dom}(r)|$ vertices $v \in \mathrm{dom}(r)$.

ε-flexibility

We say that G with the list assignment L is ε-flexible if every request is ε-satisfiable.

Weighted flexibility

Weighted request

Let L be a list assignment for a graph G. A weighted request is a function w that to each pair (v, c) with $c \in L(v)$ assigns a nonnegative real number.

ε-satisfiable request

Let $w(G, L) = \sum_{v \in V(G), c \in L(v)} w(v, c)$. For $\varepsilon > 0$, we say that w is ε-satisfiable if there exists an L-coloring ϕ of G such that

$$\sum_{v \in V(G)} w(v, \phi(v)) \geq \varepsilon w(G, L).$$

Weighted ε-flexibility

We say that G with the list assignment L is weighted ε-flexible if every weighted request is ε-satisfiable.

Previous results

Theorem (Dvořák, Norin, Postle 16')

For every integer $d \geq 0$, there exists $\varepsilon > 0$ such that every d-degenerate graph with an assignment of lists of size at least $d+2$ is weighted ε-flexible.

Theorem (Dvořák, Norin, Postle 16')

For every integer $d \geq 0$, there exists $\varepsilon > 0$ as follows. If G is a graph of maximum average degree less than $d + 1 + 2/(d+4)$ then G with an assignment of lists of size $d+2$ is weighted ε-flexible.

Previous results

Theorem (Dvořák, Norin, Postle 16')

For every integer $d \geq 0$, there exists $\varepsilon > 0$ such that every d-degenerate graph with an assignment of lists of size at least $d + 2$ is weighted ε-flexible.

Theorem (Dvořák, Norin, Postle 16')

For every integer $d \geq 0$, there exists $\varepsilon > 0$ as follows. If G is a graph of maximum average degree less than $d + 1 + 2/(d + 4)$ then G with an assignment of lists of size $d + 2$ is weighted ε-flexible.

Theorem (Dvořák, Norin, Postle 16')

There exists $\varepsilon > 0$ such that every planar graph G with an assignment of lists of size 6 is ~~weighted~~ ε-flexible.

Previous results

Corollary

There exists $\varepsilon > 0$ such that each planar graph

- of girth 4 with assignment of lists of size 5 is weighted ε-flexible.
- of girth 5 with assignment of lists of size 4 is weighted ε-flexible.
- of girth 10 with assignment of lists of size 3 is weighted ε-flexible.

Previous results

Corollary

There exists $\varepsilon > 0$ such that each planar graph

- of girth 4 with assignment of lists of size 5 is weighted ε-flexible.
- of girth 5 with assignment of lists of size 4 is weighted ε-flexible.
- of girth 10 with assignment of lists of size 3 is weighted ε-flexible.

Euler's formula trivially implies that planar triangle-free graphs are 4-choosable and that planar graphs of girth 6 are 3-choosable.

Our results

Theorem (Dvořák, TM, Musílek, Pangrác 17+)

There exists $\varepsilon > 0$ such that each planar triangle-free graph with assignment of lists of size 4 is weighted ε-flexible.

Our results

Theorem (Dvořák, TM, Musílek, Pangrác 17+)

There exists $\varepsilon > 0$ such that each planar triangle-free graph with assignment of lists of size 4 is weighted ε-flexible.

Theorem (Dvořák, TM, Musílek, Pangrác 17+)

There exists $\varepsilon > 0$ such that each planar graph of girth 6 with assignment of lists of size 3 is weighted ε-flexible.

Schema of the proof(s)

1. Lemma by Dvořák, Norin, Postle 16'
2. Reducible configuration
3. Discharging

Schema of the proof(s)

1. Lemma by Dvořák, Norin, Postle 16'
2. Reducible configuration
3. Discharging

For all integers $g, k \geq 3$ and $b \geq 1$, there exists $\varepsilon > 0$ as follows. Let G be a graph of girth at least g. If for every $Z \subseteq V(G)$, the graph $G[Z]$ contains an induced $(g-3, k)$-reducible subgraph H with at most b vertices, then G with any assignment of lists of size at least k is weighted ε-flexible.

1. for every vertex $v \in V(H)$, H is L-colorable for every assignment L, such that $|L(v)| = 1$ and $|L(w)| \geq \deg_H(w)$ for all $w \neq v$,
2. for every $(g-3)$-independent set S of size at most $k-2$, H is L-colorable for every assignment L such that $|L(v)| \geq \deg_H(v) - 1$ for $v \in S$ and $|L(v)| \geq \deg_H(v)$ otherwise.

Schema of the proof(s)

1. Lemma by Dvořák, Norin, Postle 16'
2. Reducible configuration
3. Discharging

For all integers and $b \geq 1$, there exists $\varepsilon > 0$ as follows. Let G be a graph of girth 4. If for every $Z \subseteq V(G)$, the graph $G[Z]$ contains an induced $(1,4)$-reducible subgraph H with at most b vertices, then G with any assignment of lists of size at least 4 is weighted ε-flexible.

1. for every vertex $v \in V(H)$, H is L-colorable for every assignment L, such that $|L(v)| = 1$ and $|L(w)| \geq \deg_H(w)$ for all $w \neq v$,
2. for every independent set S of size at most 2, H is L-colorable for every assignment L such that $|L(v)| \geq \deg_H(v) - 1$ for $v \in S$ and $|L(v)| \geq \deg_H(v)$ otherwise.

Schema of the proof(s)

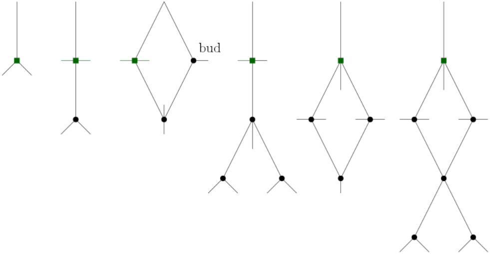
1. Lemma by Dvořák, Norin, Postle 16'
2. Reducible configuration
3. Discharging

- Vertices of degree at most 2,
- Two adjacent vertices of degree 3.

Schema of the proof(s)

1. Lemma by Dvořák, Norin, Postle 16'
2. Reducible configuration
3. Discharging

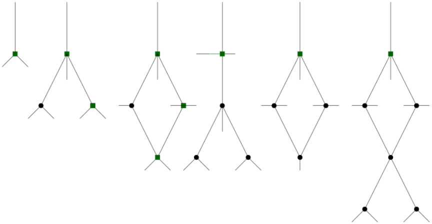
Let C be an outer face and each (≤ 5)-cycle bounds a face.
A vertex $v \notin V(C)$ of degree $d \geq 3$ st. it has $d-1$ (v, C)-good neighbors using distinct buds.



Schema of the proof(s)

1. Lemma by Dvořák, Norin, Postle 16'
2. Reducible configuration
3. Discharging

Let C be an outer face and each (≤ 5)-cycle bounds a face.
A vertex of G of degree 5 contained in a 4-face $vv_1v_2v_3$ such that $\deg(v_1) = \deg(v_3) = 3$, $\deg(v_2) = 4$, and $v, v_1, v_2, v_3 \notin V(C)$ st. it has a (v, C)-excellent neighbor x distinct from v_1 and v_3.



Schema of the proof(s)

1. Lemma by Dvořák, Norin, Postle 16'
2. Reducible configuration
3. Discharging

Open questions

Does there exist $\varepsilon > 0$ such that every planar graph with anassignment of lists of size 5 is weighted ε-flexible? Or at least ε-flexible?

Does there exist $\varepsilon > 0$ such that every planar graph of girth at least 5 with an assignment of lists of size 3 is weighted ε-flexible? Or at least ε-flexible?

Open questions

Does there exist $\varepsilon > 0$ such that every planar graph with anassignment of lists of size 5 is weighted ε-flexible? Or at least ε-flexible?

Does there exist $\varepsilon > 0$ such that every planar graph of girth at least 5 with an assignment of lists of size 3 is weighted ε-flexible? Or at least ε-flexible?
